Bach C major prelude: patterning and symmetrical structure

# Classical music and transformation

---

- Transformation is a comparatively recent phenomenon. The idea of transformation only emerged from the eighteenth century with the rise of classicism and, in music specifically, in the development section of sonata form. Particular composers:
- Haydn, Beethoven, Brahms

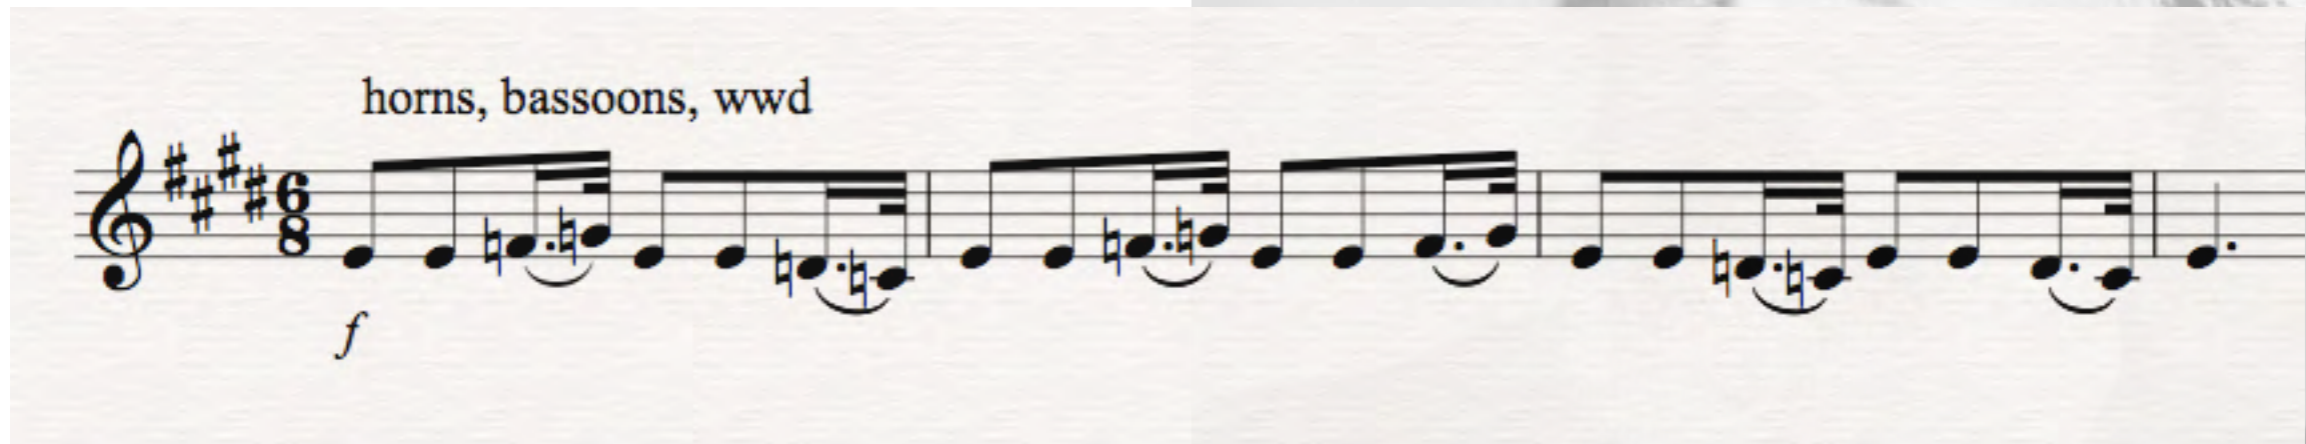

# Romantic music and transformation

---

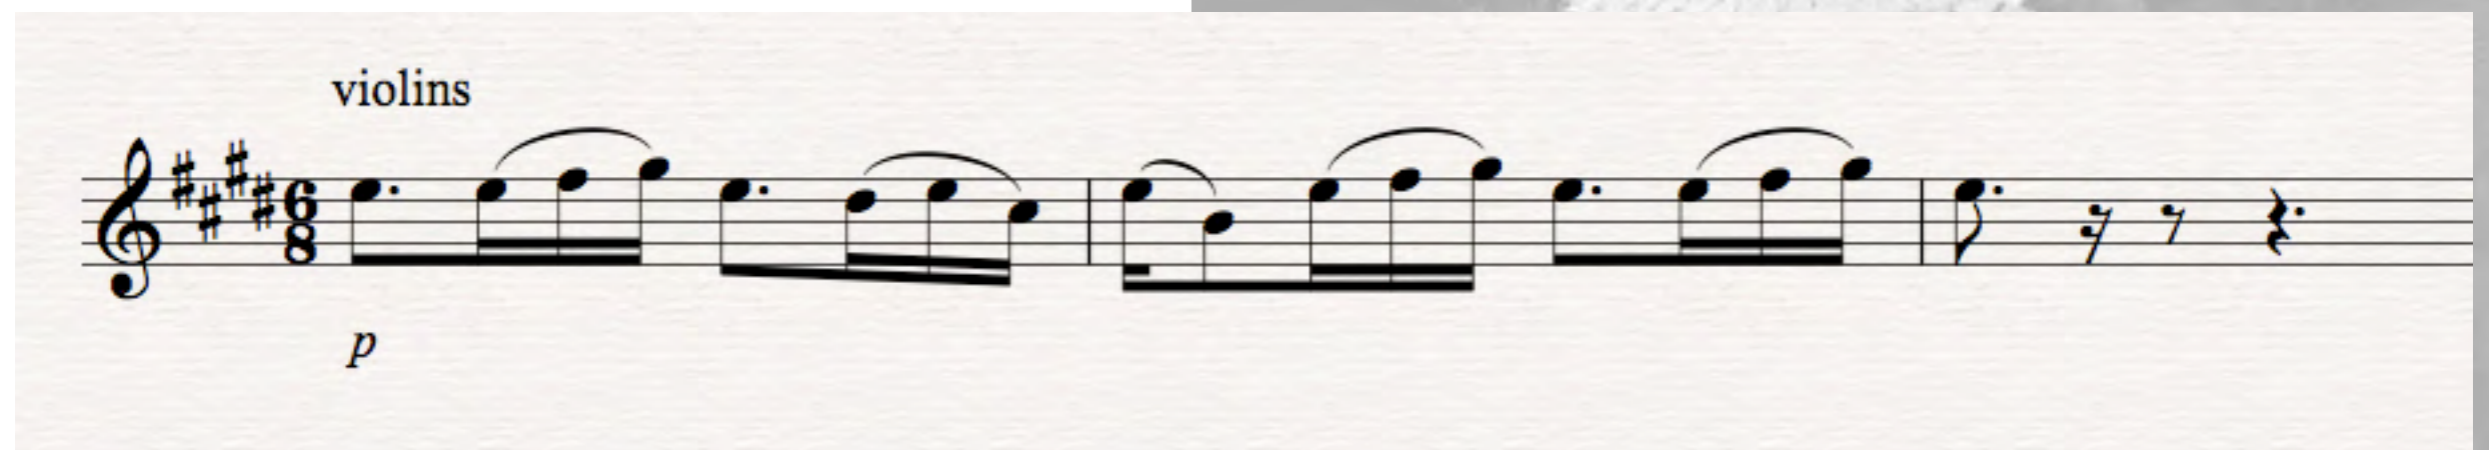

- Brahms's 4th Symphony (1885), 2nd movement

horns, bassoons, wwd

# Brahms

---

- Brahms's 4th Symphony, 2nd movement

The image displays two staves of musical notation from Brahms's 4th Symphony, 2nd movement, overlaid on a faded portrait of the composer. The top staff is for the woodwinds (wwd.) and horns, marked with a forte (*f*) dynamic. It features a treble clef, a key signature of three sharps (F#, C#, G#), and a 6/8 time signature. The notation includes a quarter rest followed by a series of eighth notes, some grouped in triplets (indicated by a '3' above the notes), and a final quarter note. The bottom staff is for the violoncelli (cellos), marked with a piano (*p*) dynamic and the instruction *dolce sempre*. It also uses a treble clef, the same key signature, and time signature. The notation consists of a continuous line of eighth notes, with some notes beamed together and others separated by slurs. The background image is a black and white portrait of Johannes Brahms, showing his characteristic beard and hair.

# Transformation as a Central Idea

---

- Trevor Wishart, Red Bird (1980)

**Red Bird** is not only a piece of music, but also a journey into an alternative world. When we listen to a piece of pure sonic art such as Red Bird, we bypass the theatre of the concert hall, and are cast adrift in an entirely aural universe. The whole environment is defined by the dynamic process of sound events. Sounds may again take on some of the 'magical' power they must have had for pre-literate peoples - a significance and resonance muted by the dominance of written language in our culture. If we allow ourselves, we can enter that state of perception where the environment is vibrant with significant sounds and symbols and in which myths have their power.

# Trevor Wishart Red Bird (1980)

---

- Trevor Wishart, Red Bird (1980)

**Red Bird** is both a piece of music and a mythic retelling of the world. The underlying structural idea, as far as it can be put into words, is the conflict between 'open' and 'closed' conceptions of reality. This conflict may be expressed in a number of different ways (political, philosophical, technological...). I don't wish to explain this further, as I prefer the music to speak for itself. I will only add that such interpretations of reality are complementary, rather than conflicting - all reflect a 'deep structure' represented by the myth. What is straightforward in one interpretation may be metaphorical in another.

# Trevor Wishart Red Bird (1980)

---

- Trevor Wishart, Red Bird (1980)

The sound world of **Red Bird**, as a myth, deals with complex ideas, but aims to distil the essence of these ideas and articulate them in an archetypal form. To do this it uses only a limited set of recognisable sounds, in particular....

**Birds:** real calls selected for their musical properties

**Animal/**

**Body:** including breath, fluids and inarticulate vocals

**Words:** especially 'listen to reason, and 'reasonable' and their syllables

**Machines:** sonic constructions made from words or animal/body sounds

Transformation: Book to Door (1' 54")

Here the transition is from the sound of a book slamming on a table to that of a slamming door. Neither sound is easily recognised out of context, especially when the sounds have to be stripped to their bare essentials (a percussive bang) to make the transition from one to the other. Hence the book is established by the context of pages being turned and the attempt to swat a fly, The slam is then gradually lowered in pitch to better match the door slam, As the door slam is repeated, the sound of the handle is gradually introduced (door context), and it finally merges into a stereo texture of many different doors. Where the sounds meet in the middle, the sequences of sounds are wrapped into each other, i.e., the (pitch-raised) door occurs in the sequence before the (pitch-lowering) book has concluded. (i.e., where the ear expects book) and the two semi-alternate until the book is eventually left behind,

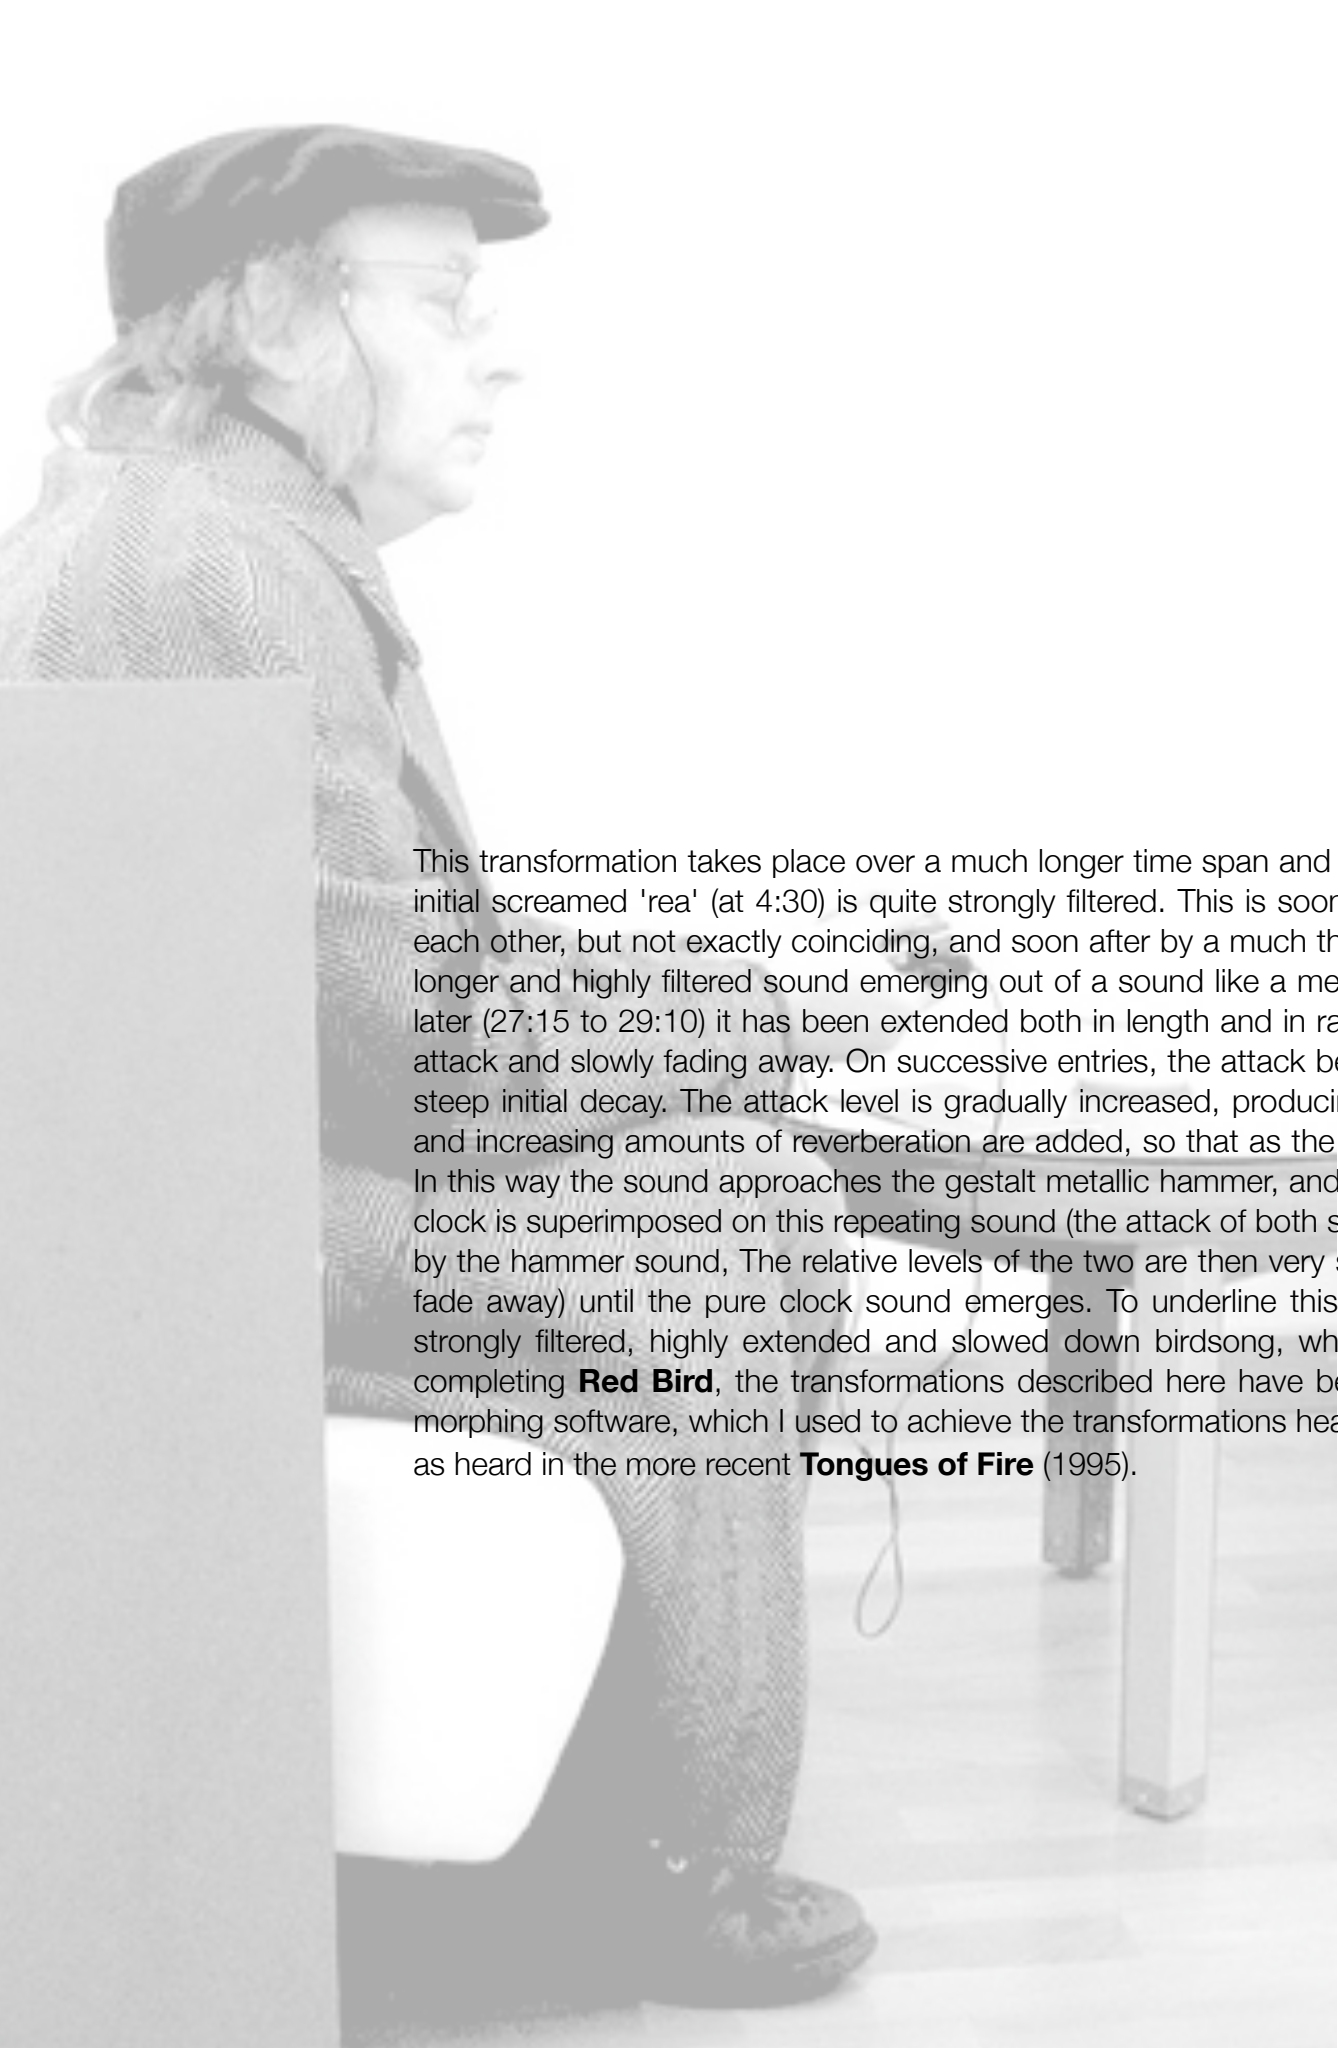

# Trevor Wishart Red Bird (1980)

Transformation: 'Liss to Bird' (20")

In this example, the vocal syllable 'liss' transforms into the sound of birdsong. This transformation is achieved by a mixture of vocal mimicry and textural *melange* (a kind of self-masking) as indicated in the diagram. In this case the two poles of the transformation are clearly recognised without contextualising clues and the transformation passes through an artificial acoustic space generated by mixing it into a mono stream.

---

Transformation: Screamed 'rea' to clock (3'22")

This transformation takes place over a much longer time span and also goes through a number of intermediate recognisable gestalts. The initial screamed 'rea' (at 4:30) is quite strongly filtered. This is soon followed by a texture of three screamed 'reas' (at 4:36) layered over each other, but not exactly coinciding, and soon after by a much thicker texture. It also occurs at this stage extended into a much denser, longer and highly filtered sound emerging out of a sound like a metal hammer (from 6:05 to 6:27). When this sound texture occurs again later (27:15 to 29:10) it has been extended both in length and in range of pitches. It now occurs with a specific 'envelope', i.e., a sudden attack and slowly fading away. On successive entries, the attack becomes more and more pronounced and is followed by an increasingly steep initial decay. The attack level is gradually increased, producing extra harmonic content from resonances in the reverberation plate, and increasing amounts of reverberation are added, so that as the initial sound becomes shorter, its reverberated decay becomes longer. In this way the sound approaches the gestalt metallic hammer, and no longer sounds vocal. Finally (from 29:10 to 33:00) the sound of the clock is superimposed on this repeating sound (the attack of both sounds coinciding), initially extremely quietly, so that it is entirely masked by the hammer sound. The relative levels of the two are then very slowly reversed, and there is a shift in context (the breath-wind sounds fade away) until the pure clock sound emerges. To underline this, the ensuing alarm provides a context clue. Yet this sound is in fact strongly filtered, highly extended and slowed down birdsong, which rapidly defilters, speeds up and becomes a flock of birds. Since completing **Red Bird**, the transformations described here have become much easier to produce. I developed some of the first sound-morphing software, which I used to achieve the transformations heard in **Vox 5** (1986), and have since greatly expanded those techniques, as heard in the more recent **Tongues of Fire** (1995).

# Trevor Wishart Vox 6 (1980)
